Osvrt na predavanje;

Osnovni logički operatori nad slikama

Student; Katarina Hubzin

Operator presjek- I

Kombinacijom piksel slike A i B dobivamo piksel slike C.

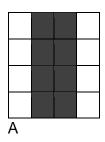

-"I" osnovni logički operator- presjek podataka piksela dvije slike "1" označava crni piksel

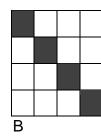

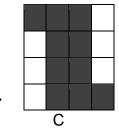

Piksel slike A ulazi u kombinatoriku s pikselom iste pozicije slike B (u primjeru moguće 4 kombinacije: 0,0 0,1 1,0, 1,1)

Opetor (I) je dobio ime kad je " 1 vani" što odgovara kombinaciji 1,1, što znači da će crni pikesl biti i na slici C (C=A*B)

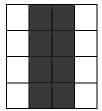

Operator presjek- ILI

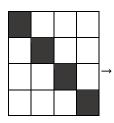

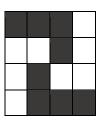

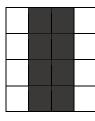

Operator EX-NILI

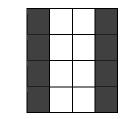

Operator NE

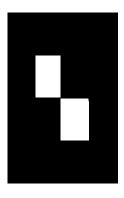

Operator "NI"

-negirani operatora I

-Nula je "vani" kada su oba (A i B) 1, a ostalo je negirano ($C = \overline{A}x\overline{\overline{B}}$)

Operator "NILI"

Kada su obje kombinacije 0

C=A+B

Operator "EXNILI"

-jedinica je vani kada su jednake varijable, a kada su različite dobivamo 0)
